S1188=ON, S1214=ON, S1239=ON, S1244=ON, S1275=ON, S1305=ON,
S1308=ON, S1352=ON, S1395=ON, S1452=ON, S1555=ON, S1572=ON,
S1579=ON, S1582=ON, S1631=ON, S1651=ON, S1655=ON, S1771=ON,
S1796=ON, S1853=ON, S1891=ON, S1898=ON, S1968=ON, S2059=ON,
S2129=ON, S2137=ON, S2161=ON, S2186=ON, S2195=ON, S2206=ON,
S2214=ON, S2218=ON, S2227=ON, S2247=ON, S2258=ON, S2308=ON,
S2325=ON, S2344=ON, S2355=ON, S2363=ON, S2398=ON, S2406=ON,
S0000=OFF, S0001=OFF, S0003=OFF, etc.... (all 2,419 other sensors are OFF) }

Motivation IV: Correlations among sensors? (Not Quite)

Slide 5/45

How to get grid structure?

“Connect each sensor to top 8 most correlated others.”
Pierce & Kuipers (1997)

Implicitly gives computer domain knowledge:

- That each node has 8 neighbors
- That domain is 2D
- That domain is spatial

Motivation V

Slide 6/45

Can't rely on knowledge-engineering
E.g., Highway Traffic speed sensors

Problem, Claims, & Evaluation Criteria

Slide 7/45

Problem Statement:

How can a computer develop rich relational theories from raw sensor data?

Claims:

- 1 Partially implemented *design* for bridge from sensors to relational theory
- 2 1st link of bridge builds and uses conceptual structures

Evaluation:

- 1 Bridge story should be **elegant**. We rely on a few principles:
 - **Minimum Description Length** (MDL)
 - **"Signatures"** for recognizing patterns and binding (HMax idea)
 - **"Crunching"** by finding big/frequent overlap to "explain" data
- 2 System should be **independent of modality** (vision, audio, etc.)
 - Minimal innate knowledge
 - Should work on wide range of domains
 - Might even be in 5 Dimensional world
- 3 Theory learned by the system should
 - allow for compression of data Wolff (2003)
 - contain concepts *useful* for tasks

Introduction

Solution Overview: The Bridge

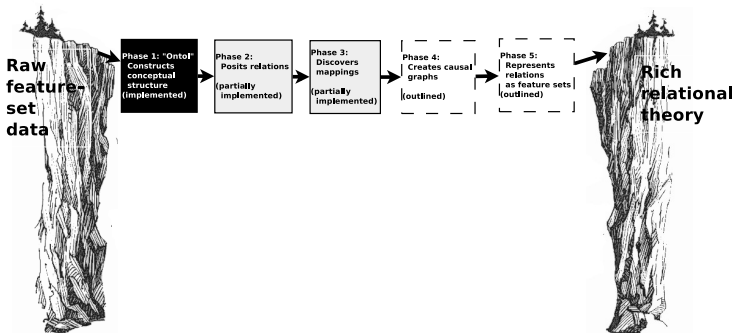

Slide 8/45

- All thesis work is building or testing parts of bridge
 - Test on multiple disparate domains
 - Concrete “side applications” along the way
 - Data Compression, Macros in RL, Semi-supervised Learning
 - A few recurring principles: MDL, Signatures, Crunching
- Phase 1 is core of dissertation
- Other phases are bonus

Phase 1:

Creating A Feature-Set Ontology

Parsing and Inference with An Ontology

Slide 12/45

Introduction

A Feature-Set
Ontology

Application to
Supervised
Learning

Parameterized
Concepts

Finding Useful
Mappings

Apples to
Angles

Conclusion

References

- “Inference” does bottom-up “abduction” & “top-down” unfolding like HTMs:
 - AND nodes want all their children to be ON
 - OR nodes want at least 1 child ON
 - All nodes want to be “explained” from above
 - (Can have inhibitory connections too)
- “Parse”: Minimal* set of ON/OFF node settings to re-infer inputs
- Best parse minimizes “Probabilistic MDL” function
$$E_R(R_i) = -\log_2(P(D_i|R_i, \Omega)) - k \sum_{r \in R_i} \log_2 P(r|\Omega)$$
- Parse algorithm searches for this
- Optimal Parsing is NP-Hard (proof in thesis)

Building An Ontology: Chunking

Slide 13/45

Terminology note:

Ontol system that builds and *uses* ontologies
The **Cruncher** part of Ontol that builds ANDs

How Cruncher Works:

- Search to minimize
$$E(\Omega) = k|\Omega| - \sum_i \max_{R_i} (\log_2(P(D_i|R_i,\Omega))) + k \sum_{r \in R_i} \log_2 P(r|\Omega)$$
- "The Cruncher" does this by recursively squeezing out feature-set overlap.
E.g., if
 - $S1 = \{A, B, C, D, E\}$
 - $S2 = \{A, B, C, D, F, G\}$
 - $S3 = \{A, B, C, \text{not } D, F, G\}$
 - $DL = 17$
- Then, new set $N1 = S1 \cap S2 = \{A, B, C, D\}$. Then
 - $S1 = \{N1, E\}$, $S2 = \{N1, F, G\}$, $S3 = \{N1, \text{not } D, \text{not } D, F, G\}$
 - $DL = 14$
- Then, new set $N2 = S2 \cap S3 = \{N1, F, G\}$. Then
 - $S1 = \{N1, E\}$, $S2 = \{N2\}$, $S3 = \{N2, \text{not } D, \text{not } D\}$
 - $DL = 13$

Cruncher Algorithm:

```
// Returns an ontology that compactly expresses S
Cruncher(S) (where S is a set of attribute-value sets)
  let B be a set of ConceptNodes such that S
    foreach attribute-value A in S there is a corresponding ConceptNode c in B
      such that A ∈ c.hasA and c.isA = ∅.
  while we are still decreasing the description length of B
    candidates = findAllIntersections (B)
    // score is the potential decrease in description length
    compute score(B, candidate) foreach element in candidates
    let best be the highest scoring candidate
    if score(B, best) > 0 then let B = replaceBest(B, best) + best
  return B
```

- Parameterized Concepts
- Finding Useful Mappings
- Applies to Angles
- Conclusion
- References

- Cruncher forms taxonomic categories naturally
- Penguin in multiple classes
- Octopus erroneously grouped with Amphibians:

	eggs	aquatic	predator	haslegs	hair	domestic	breathes	toothed	backbone
Octopus	yes	yes	yes	yes	no	no	no	no	no
Amphibians	yes	yes	yes	yes	no	no	yes	yes	yes
Invertebrates	?	?	?	?	?	?	?	no	no

Crunching Patches from Natural Images

Slide 15/45

- In Zoo ontology, $\text{node102} = \{\text{toothed, hair, milk, 4-legs}\}$ (i.e., "Mammal")
- What do concepts for other Crunched feature-set sets look like?

Input: 50x50 Image Patches (undifferentiated)

Concepts Learned

- These concepts are *useful* for describing dataset
- Contiguous chunks
- Cruncher begins with no knowledge of which pixels are next to which

Evaluating Ontol/Cruncher

Slide 16/45

How to evaluate?

- Can eyeball zoo dataset, but many others too complex
- Primary goal: help span gap between raw sensors and rich theory (difficult to gauge progress)
- Applications: Ontol/Cruncher developed for main goal, but works on “side applications” too:
 - Compression
 - Macro-actions in Reinforcement Learning
 - Semi-supervised Learning
- Test on range of well-known UCI datasets

Dataset	Description	Prediction
connect-4	States of Connect 4 boards	win, loss, tie
house-votes-84	Congressional voting records	democrat, republican
kr-vs-kp	Chess endgame features	white win or nowin
mushroom	Mushroom features	poisonous or edible
nursery	Nursery schools features	recommendation: very, not, priority , etc.
SPECT	Features from cardiac images	normal or abnormal
tic-tac-toe	tic-tac-toe game states	x win or nowin
zoo	Features of animals	mammal, amphibian, fish , etc.

Conclusion

References

Compression Performance of Ontol/Cruncher

Slide 17/45

Compression (Lower is Better)

- Ontol not for all text files (just feature-set descriptions)
- Lossless because files are sorted (otherwise add $\log_2(|items|!)$ to specify ordering)
- Cruncher doesn't compress gensyms (so use LZ to do this)

Application: Creating Macro-actions in RL

(Pickett & Barto (2002))

- Crunch policies from many MDPs with same structure but different reward
- Use “crunched” subpolicies as policy building blocks or “macro-actions”

How To Learn from a Few Positive Instances

Slide 21/45

$$\text{Bayesian Energy Function: } E_{SS}(M) = |D| \log_2 N(M) + |M| \log_2 |U| - \sum_{M_i \in M} \log_2 N(M_i)$$

- 1 Build ontology from unlabeled training set
- 2 Search for Boolean expression M (which may use nodes in ontology), s.t.
 - M is *True* for all positives
 - M is *False* for negatives (if any)
 - M minimizes $E_{SS}(M)$

(Negatives unnecessary, but *can* be used)

Semi-supervised Experiment Setup

Slide 22/45

Experiment: given P & N (# of *Positive* & *Negative* instances to use):
& *unlabeled* training set
& *labeled* training set
& *labeled* testing set

- 1 Build ontology from *unlabeled* training set
- 2 Average over 100 trials:
 - 1 randomly pick class to learn from *labeled* training set
 - 2 randomly pick P positive instances from class (& N negatives)
 - 3 search for Boolean expression M to minimize $E_{ss}(M)$
 - 4 use M to classify testing set

Back to Ontology Building

Slide 25/45

- Crunching gives **ANDs**
- What about **ORs**?

Building ORs: Merging

Slide 26/45

- Merging finds “OR”s or Equivalence Classes
- Interchangeable concepts form OR
- Find ORs by Crunching context

Building ORs: Merging

Slide 27/45

Artificial "grammar" for creating bags of features.

```
< S > ::= [< doubles > < M >]
< M > ::= < A > (with probability .4) | < B > (with probability .6)
< A > ::= < 4 > | < 5 > | < 6 > | < 7 >
< B > ::= < 1 > | < 2 > | < 3 >
< doubles > ::= < AA > | < BB > | < CC > | < DD > | < EE > | < FF > | < GG >
< 1 > ::= 1A | 1B | 1C | 1D | 1E | 1F
< 2 > ::= 2A | 2B | 2C | 2D
< 3 > ::= 3A | 3B | 3C | 3D | 3E | 3F
< 4 > ::= 4A | 4B | 4C
< 5 > ::= 5A | 5B | 5C | 5D | 5E
< 6 > ::= 6A | 6B | 6C | 6D | 6E | 6F
< 7 > ::= 7A | 7B
< AA > ::= aa | Ø
< BB > ::= bb | Ø
< CC > ::= cc | Ø
< DD > ::= dd | Ø
< EE > ::= ee | Ø
< FF > ::= ff | Ø
< GG > ::= gg | Ø
```

E.g., {cc, dd, gg, 4C, 5A, 6B, 7B}
{aa, bb, dd, 1F, 2A, 3A}
{cc, dd, ee, 4C, 5A, 6C, 7B}

"Context" as Cooccurrence Matrix

Each row really just bags of features

So, Crunch context to get candidate Equivalence Classes

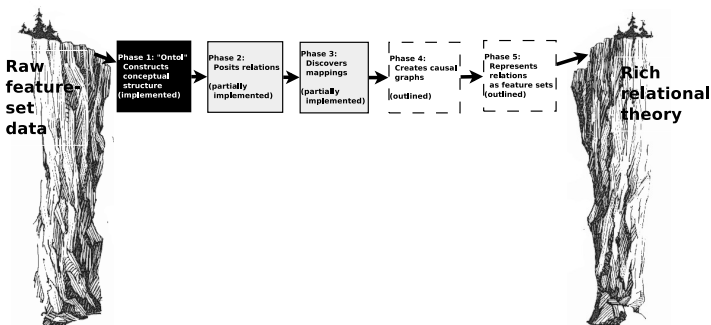

Will integrate with crunching in future work.

Behavioral Signatures

Slide 32/45

- To find similar regions, create signatures
- Same core idea as representing “dog” shape (HMax)

To “sample” from inputs of graph (using sample size = 3):

- 1** Grab 3 nodes randomly (e.g. C, Y, & Z)
- 2** Make Karnaugh map for X over all 8 combos of ON/OFF for C, Y, & Z
- 3** Tally up 1 more for **TTFFTFTT**
- 4** Canonicalize:
Try all 3! orderings of C, Y, Z to find 1st alphabetically
- 5** (Do steps 2-4 for K-maps for D & W too)
- 6** GOTO 1 and Repeat

	Y	~Y	
C	T	T	F
~C	T	F	T
	Z	~Z	Z
